

SedonaCloud - Technical Configuration - New API Endpoints

01/05/2024 11:18 am EST

optavalartaxgroup/{id}

- api/optavalartaxgroup/{id}
 - GET
 - id = 5-digit zip code
- api/optavalartaxgroup/search
 - POST
 - Body must contain the following JSON model

```
{
  "Zip_Code": 33715,
  "TaxingGroupCode": null,
  "State": null,
  "County": null,
  "City": null,
  "Enforce_Filter": false
}
```

- the 'Zip_Code' value is required

api/CustomerRecurring/GetRMRTTrackingHistory

This returns all AR_RMR_Tracking records.

- The returned model uses the already existing RMRTTracking viewmodel, used by other 'api/CustomerRecurring' endpoints. SedonaCloud already had service logic to retrieve the AR_RMR_Tracking records and map to the RMRTTracking viewmodel.
- OData query options can be used to select history for a specific customer and to select only the fields required.

Note: The SO Recurring History view shows the RMR Amount as either a 'Decrease/Remove' or 'Increase/Add' entry. This is based on if the RMR Amount is > 0 (Increase/Add) or <0 (Decrease/Remove). The 'api/CustomerRecurring/GetRMRTTrackingHistory' endpoint does not present these 2 columns, just RMRAmount. Consumers of the endpoint should analyze the positivity of the RMRAmount value for additional logic if necessary.

/api/paymentmerchant/captureauthorizedtransaction

New Capture endpoint utilizes the capture function in SedonaOffice, populating it with Forte Payments.

- POST
- Body must contain the following JSON model

```
{
  "CustomerNumber": "10741",
  "CustomerCreditCardId": 48,
  "CustomerBankId": 0,
  "ForteAuthorizationCode": "7TY485",
  "ForteTransactionId": "02802880-78c9-4295-aa36-64999ef81eef",
  "AuthorizedAmount": 16.52,
  "Invoices": [
    {
      "InvoiceID": 1227,
      "InvoiceNumber": 301318,
      "NetDue": 16.52,
      "Amount": 16.52
    }
  ]
}
```
