

SedonaWeb 1.0 - 2.7.79 - 12/8/2021

01/05/2024 5:47 pm EST

Bugs:

Last Four on Customer Bank Transactions Missing [16970, 18795] (19037)

Issue: Appears SedonaWeb payments made are omitting the last four digits from the customer's bank record on-file they're using to make a payment.

Solution: On the payment selection page, the last four digits database column was not included in the query that built the Bank Account list. Added the last four digits to the query.

Online bill pay shows pending for customer, but rejected for dealer [18832, 19758] (19640)

Issue: We are having issues with customers making payments on our website. Once they submit payment it shows pending on the customers end and rejected on our end. The screenshot below is just one example, it happens to anyone who tries to pay online.

Solution: Removed expired credit cards from payment options and added a warning message based on the message displayed in SedonaOffice.

Since upgrade, web payments are NOT showing that they originated from the Web in the EFT history. [16813] (19078)

Issue: Since upgrade, web payments are NOT showing that they originated from the Web in the EFT history.

Solution: When SedonaWeb Legacy was changed to use the new Payment Processing assemblies certain behaviors also changed that customers prefer to still have - like having "Web:" in the description to indicate that it originated from SedonaWeb Legacy and the last 4 digits of the bank number.

Modified the SedonaOffice stored procedure, dbo.ACH_Add, to add this missing information when the application calling the database is SedonaWeb Legacy.
