

Sedona-X user able to access information but unable to write it while a Company Admin

02/09/2024 4:39 pm EST

When Sedona-X users are being set up, they need to link them to an employee record. However, if you set the user's permissions to Company Admin, you will still be able to log in and see data because your permissions don't require you to have an ID to call SedonaOffice. You will only notice something is wrong when you try to write data. If someone is set to admin but can't make any changes that require writing data, check to ensure their Employee is selected in SedonaCloud API.
