

Transactions Allowed When Physical Was Created to Lock the Warehouse

09/13/2024 6:52 pm EDT

Issue:

A Physical count batch was created and the option to Lock Warehouse was selected.

The screenshot shows the 'My Lock Edit' window with the 'Setup Information' tab selected. The 'Detail' section contains the following fields and values:

- Description: My Lock
- Warehouse: Mine
- Start Date: 3/28/2024
- Lock Warehouse: ☒

The 'Count Sheet' section contains the following fields and values:

- Sort Count Sheet By: Product Line
- Then: Row
- Then: Part Code
- Print Value on Variance: ☐
- Print Quantity on Sheet: ☐
- File Skipped Parts As Zero Quantity: ☐

Buttons at the bottom include 'Release Physical', 'View Variance List', 'Save', and 'Close'.

Transactions were still allowed in the warehouse after the count was created.

Why?

Resolution:

The start date defined is the date that the Physical Count should be the date the count will be done in the warehouse(s).

The start date is also the **only date** that a warehouse will be locked from activity.

On the Start Date, users will receive a message that inventory cannot be relieved because the warehouse has been locked.

If the entering of the final counts into SedonaOffice takes more than one day to complete, users will be able to continue

all inventory activity starting on the day after the start date.

SedonaOffice will keep track of the transactions that take place after the start date. The application will automatically adjust the on-hand quantity of parts taking these transactions into account after the physical has been released.

The release date of your inventory must always be the same date as your start date so that on hand amounts are modified for activity taking place after the actual date of the count.
